The company Optocomponents GmbH specializes in the production of active and passive optoelectronic components for optical waveguide technology. In addition to a comprehensive standard program of optoelectronic components for the communication via plastic optical fibers (POF) as well as over optical fibers, Optocomponents GmbH manufactures its own fiber optic connectors, connector bodies, diode holders (receptacles), housings and accessories. Another core business is the customer-specific assembly of fiber-optic cables (POF, HCS and glass). Production and sales of fiber-optic interface converters complete the Optocomponents program. The program includes standard converters for RS232, RS422, TTL, Profibus, Interbus-S and USB. In addition, the product range has been expanded to include transceivers in 1x9 format for industrial Fast Ethernet applications using plastic optical fibers (POF). These products are available with different connection systems. Customer-specific solutions are one of our strengths. Give us the opportunity to prove it.
