Welcome to Antriebe Neumann GmbH! As our latest innovation, we offer low-speed permanent magnet generators. These are used, for example, in wind turbine applications and can be directly coupled without the need for a gearbox. Antriebe Neumann GmbH was founded in 1978 by Engineer (grad.) Ingolf Neumann and, from the very beginning, has focused on the distribution of electrically speed-controlled drive systems. These include AC motors together with the frequency inverters required for this type of motor, as well as DC motors and the corresponding power converters.

For our component business, we have always sought reliable manufacturing partners in order to offer consistently high-quality products. In this context, we act as the exclusive representative of Sicmemotori S.r.L. in Germany.
