MESSmatik AG has been active in the metrology sector for almost 20 years. Based on our many years of experience, we perform complete installations of monitoring systems, calibrations (SCS and factory) in our laboratory or on site, mappings of climate chambers, qualifications of measurement systems and software developments (Windows). The measurement devices which we distribute cover a wide range of applications. Naturally, we also offer advice on these devices. Products Data loggers Monitoring-System Sensors The Tinytag data loggers are robust and reliable electronic devices for monitoring temperature, humidity, CO2, power consumption and other environmental parameters with a wide range of applications in a wide variety of industries.

MDA-Net autonomously records measurement data from various sensors. Each measuring input can be assigned to a relay and analogue signal output. These are autonomously controlled by the measuring system on the basis of the configuration (e.g. threshold values). The relay circuit can be controlled with an individual time delay. The entire system is connected via a network. The advantage is that the system can be networked at different locations, which saves measuring cables and installation costs. Online SHOP
